

Prerequisites Before you begin, make sure you have the following installed:

- Node.js - <https://nodejs.org>
- PostgreSQL - <https://www.postgresql.org/download>

Step 1 - Extract Project

Unzip the submitted archive (e.g. groupC3.zip) to a folder of your choice. Open a terminal and navigate to the extracted folder and run the following in terminal:

```
cd path/to/groupC3
```

Step 2 - Install Dependencies

```
npm install
```

This reads package.json and installs all required Node.js packages.

Step 3 - Set Up the Database

3a. Create the database

Open pgAdmin, right-click Databases and create a new database called hotel.

3b. Create the schema and tables

Connect to the hotel database, open the Query Tool, then open and run hotel-2026.sql.

This will automatically create the hotelbooking schema, all tables, and insert the sample data in one step.

Note: The database is called hotel. The schema inside it is called hotelbooking. Both are created by the SQL file - you only need to create the hotel database manually first.

Please use the hotel-2026.sql file included in this submission, not the original file provided with the brief. Our version includes an additional payment table required for the payment history feature.

Step 4 - Create config.js

Create a file called config.js in the project root with your local database credentials:

```
module.exports = {  
  development: {  
    user: 'postgres',  
    database: 'hotel',  
    password: 'YOUR_POSTGRES_PASSWORD',  
    host: 'localhost',  
    port: 5432  
  }  
};
```

Replace YOUR_POSTGRES_PASSWORD with your local PostgreSQL password. config.js is not in the repository for security reasons.

Step 5 - Start the Server

`node app.js`

You should see: Crown Hotel app listening on port 3000

Step 6 - Open in Browser

Staff Access The staff portal is accessible via the Staff Login page.

Passcode: 12345

Key Pages
